

Arch配置文件

此配置文件适用于arch+sway

1.换源

(1) 换国内镜像源

`sudo nano /etc/pacman.d/mirrorlist`

```
#清华源
Server = https://mirrors.tuna.tsinghua.edu.cn/archlinux/$repo/os/$arch
#阿里源
Server = http://mirrors.aliyun.com/archlinux/$repo/os/$arch
#中科大源
Server = https://mirrors.ustc.edu.cn/archlinux/$repo/os/$arch
```

更新一下源`sudo pacman -Syyu`

(2) 添加非官方源

`sudo nano /etc/pacman.conf`

```
[archlinuxcn]
SigLevel = Optional TrustedOnly
#清华源
Server = https://mirrors.tuna.tsinghua.edu.cn/archlinuxcn/$arch
#中科大源
Server = https://mirrors.ustc.edu.cn/archlinuxcn/$arch
#阿里源
Server = https://mirrors.aliyun.com/archlinuxcn/$arch
```

(3) 导入 archlinuxcn key

```
sudo pacman -Syyu archlinuxcn-keyring
```

2、安装yay base-devel

```
sudo pacman -Syyu yay base-devel
```

2.配置中文字体（简体中文本地化）

（1）中文字体安装

```
sudo pacman -S wqy-zenhei noto-fonts noto-fonts-cjk noto-fonts-extra noto-fonts-emoji ttf-dejavu ttf-liberation
```

（2）系统设置

```
sudo nano /etc/locale.gen
```

把以下内容前的#去掉

```
zh_CN.UTF-8 UTF-8
```

然后sudo locale-gen

3.中文输入法安装（安装fcitx5和词库）

```
yay -S fcitx5-im fcitx5-input-support fcitx5-chinese-addons fcitx5-pinyin-zhwiki
```

（2）输入法主题配置

```
sudo pacman -S git
```

```
mkdir -p ~/.local/share/fcitx5/themes/dracula
```

```
git clone https://github.com/drbbbr/fcitx5-dracula-theme.git  
~/.local/share/fcitx5/themes/dracula
```

```
sudo nano ~/.config/fcitx5/conf/classicui.conf
```

#垂直候选列表

```
Vertical Candidate List=False
```

#按屏幕 DPI 使用

```
PerScreenDPI=True
```

#Font（设置成你喜欢的字体）

```
Font="思源黑体 CN Medium 13"
```

#主题

```
Theme=dracula
```

3.sway配置

(1)复制配置文件

```
mkdir -p .config/sway/  
  
cp /etc/sway/config .config/sway/config
```

(2)添加应用启动器

```
sudo pacman -S wofi
```

或

```
sudo pacman -S wmenu
```

添加wofi快捷键

```
sudo nano .config/sway/config
```

添加：

```
bindsym $mod+p exec wofi --show run
```

(3) 安装配置状态栏 (waybar)

```
sudo pacman -S waybar
```

修改.config/sway/config中bar部分为

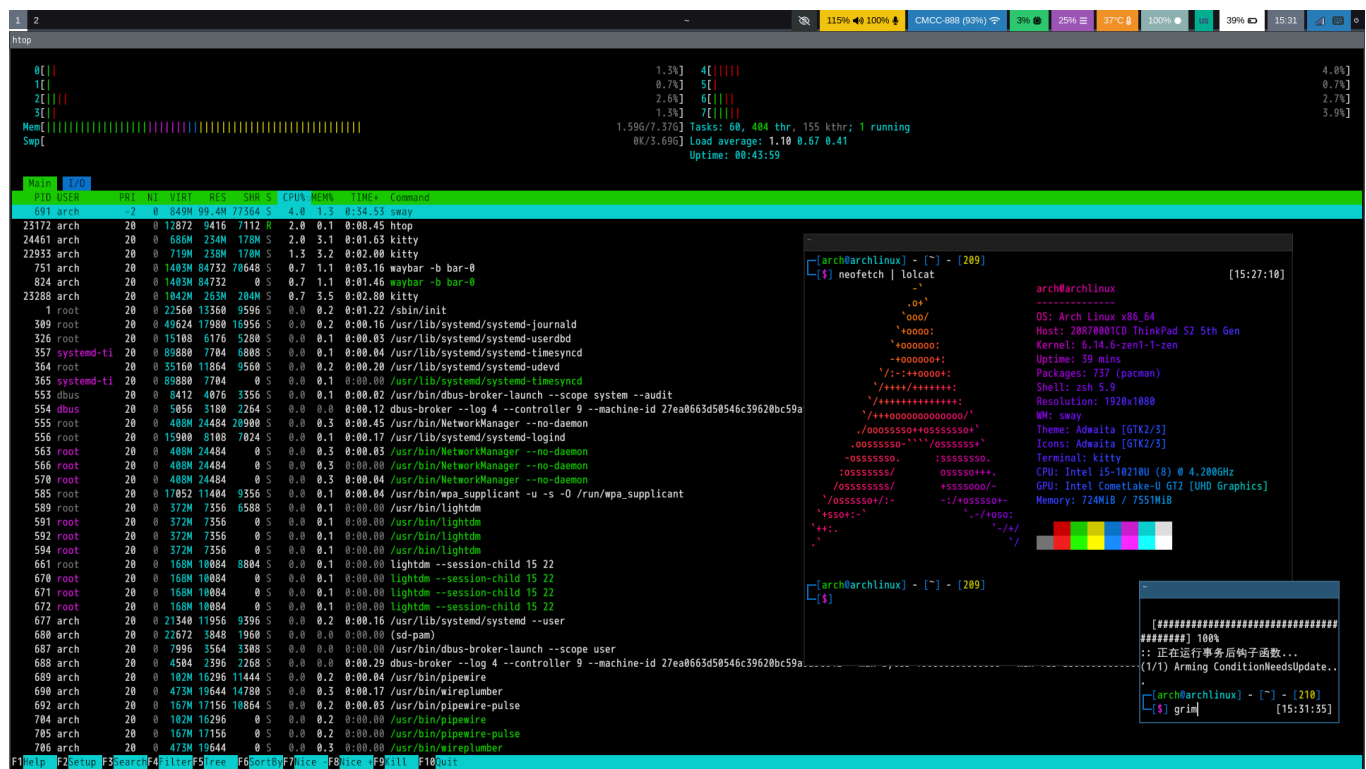

```
bar {  
    # positon top  
    swaybar_command waybar  
  
    # When the status_command prints a new line to stdout, swaybar updates.  
    # The default just shows the current date and time.  
    #status_command while date +%Y-%m-%d %X'; do sleep 1; done  
  
    # colors {
```

```
# statusline #ffffff
# background #323232
# inactive_workspace #32323200 #32323200 #5c5c5c
# }
}
```

再安装特定字体

```
sudo pacman -S ttf-font-awesome
```

结尾

终端：kitty+zsh

&一些其他命令

网络连接

```
sudo nmtui
```

(-:
